1. Introduction

1.1 Purpose

This Software Requirements Specification (SRS) defines the functional and non-functional requirements for FlowBuilder, a no-code application and workflow automation platform. The platform enables organizations to design business applications, automate approval workflows, and manage users without writing code. This document is intended to support product development, and to serve as a reference for prospective buyers and licensees evaluating the platform for purchase or white-label resale.

1.2 Scope

FlowBuilder allows a business to:

- Build custom business applications (forms, data tables, and processes) using a visual, no-code builder — comparable in spirit to platforms such as AppSheet.
- Automate multi-step approval workflows (e.g. cash advances, staff travel, customer onboarding, goods receiving, loan/finance requests) with configurable routing rules.
- Give every user a single dashboard showing the workflows assigned to them and the live status of every request they have raised or must action.
- Administer users and access through role-based permissions, so that onboarding, offboarding, and access changes require no technical involvement.

The product is designed to be sold or licensed as a standalone SaaS product to other businesses (multi-tenant), not solely for internal use.

1.3 Intended Audience

- Product & engineering team building the platform.
- QA team, for deriving test cases and acceptance criteria.
- Prospective buyers / licensees, for technical and functional due diligence.
- Sales and pre-sales teams, for scoping client-specific implementations.

1.4 Definitions, Acronyms & Abbreviations

SRS	Software Requirements Specification
Workflow	A configurable, multi-step business process (e.g. an approval chain) built on the no-code builder
Request	A single instance of a workflow raised by a user (e.g. one Cash Advance submission)

Tenant	An isolated company/organization workspace within the multi-tenant platform
RBAC	Role-Based Access Control
SLA	Service Level Agreement
OCR	Optical Character Recognition, used for document/data capture
Connector	A configured integration to an external system (e.g. email, accounting, ERP)

2. Overall Description

2.1 Product Perspective

FlowBuilder is a new, standalone, multi-tenant SaaS product. It is not an extension of an existing system. Each purchasing company ("tenant") receives an isolated workspace containing its own apps, workflows, users, and data, while the vendor (platform owner) retains a super-admin layer for provisioning, billing, and platform-wide support.

2.2 Product Summary

The platform is organized around four pillars:

1. No-Code App & Workflow Builder — drag-and-drop configuration of data tables, forms, business rules, and multi-step approval flows, without writing code.
2. Unified Dashboard — a single landing view per user showing assigned tasks, submitted requests and their live status, notifications, and performance widgets.
3. Role-Based User & Access Management — admins create roles, assign permissions, and manage the full user lifecycle from one screen.
4. Insights & Reporting — turnaround-time, workload, and bottleneck reporting across workflows.

2.3 Reference Concept

The attached reference screenshot illustrates the target dashboard experience: a notifications panel with status filters (All / Overdue / Due Today / Due in 3 Days / This Week / Pending Clarification), a per-request progress tracker, a task-completion summary widget, and a "My Workflows" shortcut list. FlowBuilder's dashboard requirements in Section 3.2 are modeled on this experience.

2.4 User Classes and Characteristics

Super Admin (Vendor)	Platform owner. Manages tenants, subscriptions, and platform configuration. Not part of any single company's day-to-day operations.
Company Admin	Full control within a tenant: builds apps/workflows, manages users and roles, views all company requests and reports.
Workflow Owner / Builder	Configures specific apps or workflows (forms, routing rules, approval stages) assigned to them.
Approver	Actions requests routed to them (approve, reject, request clarification) at one or more stages of a workflow.
Requester (Standard User)	Raises requests, tracks their own status, and completes tasks assigned to them.

2.5 Operating Environment

- Web application, accessible via modern browsers (Chrome, Edge, Safari, Firefox — latest two major versions).
- Responsive layout; native or wrapped mobile apps for iOS and Android for task actions and notifications on the go.
- Cloud-hosted, multi-tenant backend (relational database per the platform's data-isolation model).

2.6 Design & Implementation Constraints

- Must support multi-tenancy with strict data isolation between companies.
- Workflow logic must be configurable by non-technical admins (no scripting required for standard cases).
- Must be white-label-capable (logo, colors, domain) to support resale/licensing.

2.7 Assumptions & Dependencies

- Client organizations will provide their own user lists / org charts during onboarding.
- Email/SMS gateway and (optionally) OCR and accounting-system connectors are third-party dependencies configured per tenant.

3. Functional Requirements

3.1 No-Code Application & Workflow Builder

Allows a Company Admin or Workflow Owner to define new business applications and processes without writing code.

ID	Requirement Description	Priority
FR-1.1	The system shall allow authorized users to create data tables (fields, types, validation rules) through a visual interface.	Must
FR-1.2	The system shall allow authorized users to design forms bound to those data tables, including conditional fields.	Must
FR-1.3	The system shall allow authorized users to define multi-stage approval workflows with configurable routing (sequential, parallel, or conditional approvers).	Must
FR-1.4	The system shall allow reassignment of a routing stage to a specific role, individual, or “reporting manager” relationship.	Must
FR-1.5	The system shall support workflow templates that can be cloned and adapted (e.g. Cash Advance, Staff Travel, Customer Onboarding, Goods Receiving, Loan Origination).	Should
FR-1.6	The system shall allow admins to publish, version, and deactivate workflows without affecting requests already in progress.	Should
FR-1.7	The system shall support attaching documents to a request and, where configured, extracting data from them via OCR.	Could

3.2 Unified Dashboard

A single view, personalized per logged-in user, showing everything relevant to them.

ID	Requirement Description	Priority
FR-2.1	The system shall display a “My Workflows” panel listing every workflow the current user is assigned to (as requester, approver, or owner).	Must
FR-2.2	The system shall display a notifications/task list of pending items, each showing request ID, workflow name, current stage, and time elapsed.	Must
FR-2.3	The system shall allow the user to filter that list by status: All, Overdue, Due Today, Due in 3 Days, This Week, and Pending Clarification.	Must
FR-2.4	The system shall provide a search and advanced filter over the user's requests and tasks.	Should

ID	Requirement Description	Priority
FR-2.5	The system shall display a visual progress tracker per request showing completed, current, and pending stages.	Must
FR-2.6	The system shall display a task-completion summary widget (e.g. tasks completed today vs. total allocated).	Should
FR-2.7	The system shall allow Company Admins to customize dashboard widgets and layout per role.	Could

3.3 Request Submission & Status Tracking

Every request — regardless of which workflow it belongs to — must be visible with a clear, consistent status.

ID	Requirement Description	Priority
FR-3.1	The system shall allow a user to raise a new request against any workflow they are permitted to access.	Must
FR-3.2	The system shall assign every request a unique, human-readable ID and timestamp.	Must
FR-3.3	The system shall track and display request status at every stage (e.g. Submitted, Pending Approval, Clarification Requested, Approved, Rejected, Completed).	Must
FR-3.4	The system shall show requesters a consolidated “My Requests” view listing all their requests and current status, across all workflows.	Must
FR-3.5	The system shall notify a requester when their request changes status or requires clarification.	Must
FR-3.6	The system shall maintain a full audit trail (who actioned what, and when) for every request.	Must
FR-3.7	The system shall support in-line clarification requests/comments between approver and requester without restarting the workflow.	Should

3.4 Role-Based User & Access Management

Administration must be simple enough for a non-technical admin to manage independently.

ID	Requirement Description	Priority
FR-4.1	The system shall allow Company Admins to create, edit, deactivate, and delete user accounts.	Must
FR-4.2	The system shall provide a set of default roles (Company Admin, Workflow Owner, Approver, Requester) and allow custom roles to be created.	Must

ID	Requirement Description	Priority
FR-4.3	The system shall allow permissions to be assigned per role, per app/workflow (view, create, approve, admin).	Must
FR-4.4	The system shall support bulk user import (e.g. CSV) and bulk role assignment.	Should
FR-4.5	The system shall support an approval hierarchy / reporting-line structure that workflows can route against automatically.	Should
FR-4.6	The system shall log all changes to user access for audit purposes.	Must
FR-4.7	The system shall support single sign-on (SSO) for enterprise clients.	Could

3.5 Notifications

ID	Requirement Description	Priority
FR-5.1	The system shall send in-app notifications for task assignment, approaching due dates, overdue tasks, and status changes.	Must
FR-5.2	The system shall send email notifications for the same events, configurable per user.	Should
FR-5.3	The system shall support WhatsApp or SMS notification channels as an optional connector.	Could

3.6 Reports & Insights

ID	Requirement Description	Priority
FR-6.1	The system shall provide standard reports on request volume, turnaround time, and approver workload.	Must
FR-6.2	The system shall let Company Admins export reports (CSV/Excel/PDF).	Should
FR-6.3	The system shall provide a top-performers / SLA-breach insight widget on the admin dashboard.	Could

3.7 Platform Administration (Super Admin)

ID	Requirement Description	Priority
FR-7.1	The system shall allow the platform owner to provision new tenant workspaces and set subscription plans/limits.	Must
FR-7.2	The system shall allow the platform owner to monitor tenant usage for billing purposes.	Must
FR-7.3	The system shall support white-labeling (logo, color theme, custom domain) per tenant.	Should

4. Role & Permission Matrix

The table below summarizes default capabilities per role. Company Admins may further customize permissions per FR-4.3.

Capability	Super Admin	Company Admin	Workflow Owner	Approver	Requester
Manage subscription & billing	✓	–	–	–	–
Create / manage company workspaces	✓	✓	–	–	–
Build apps & workflows (no-code builder)	✓	✓	✓	–	–
Configure roles & permissions	✓	✓	–	–	–
Add / remove / deactivate users	✓	✓	–	–	–
View all requests (org-wide)	✓	✓	–	–	–
View & act on assigned tasks	✓	✓	✓	✓	–
Approve / reject / clarify requests	✓	✓	✓	✓	–
Raise a request	✓	✓	✓	✓	✓
View own dashboard & request status	✓	✓	✓	✓	✓
Access reports & analytics	✓	✓	✓	–	–
Configure integrations & OCR/connectors	✓	✓	–	–	–

5. External Interface Requirements

5.1 User Interfaces

- Responsive web application (desktop and tablet breakpoints).
- Mobile application (iOS / Android) for task actions and push notifications.

5.2 Software Interfaces

- Email/SMTP gateway for notifications.
- Optional connectors: accounting/ERP systems, document storage, OCR service, WhatsApp Business API.
- REST API for programmatic access to apps, workflows, and requests, to support integrations built by client IT teams.

5.3 Communication Interfaces

- HTTPS/TLS for all client-server communication.
- Webhooks for outbound event notifications to client systems.

6. Non-Functional Requirements

6.1 Performance

- Dashboard views shall load within 2 seconds under normal load (up to 100 concurrent users per tenant).
- The system shall support at least 10,000 active requests per tenant without performance degradation.

6.2 Security

- All data in transit shall be encrypted (TLS 1.2+); data at rest shall be encrypted.
- Role-based access control shall be enforced at the API layer, not only in the UI.
- Tenant data shall be logically isolated; no tenant shall be able to access another tenant's data.
- Passwords/credentials shall follow industry-standard hashing and complexity policies; MFA shall be supported.

6.3 Scalability & Availability

- The platform shall be horizontally scalable to onboard additional tenants without re-architecture.
- Target uptime of 99.5% or better, excluding scheduled maintenance.

6.4 Usability

- A non-technical admin shall be able to create a new user and assign a role in under 2 minutes.
- A non-technical admin shall be able to build a simple 2-stage approval workflow without vendor assistance.

6.5 Maintainability & Auditability

- All configuration changes (roles, workflows, permissions) shall be versioned and auditable.
- The system shall provide activity logs exportable for compliance review.

6.6 Compliance

- The system shall support data residency and retention configuration to meet client regulatory requirements.

7. Data Requirements

At minimum, the platform shall persist the following core entities:

- Tenant / Company
- User (profile, role, reporting line, status)
- Role & Permission (per app/workflow)
- App / Workflow Definition (forms, fields, routing rules, versions)
- Request (instance of a workflow, current stage, status, history)
- Audit Log (who did what, when, on which record)
- Notification (type, recipient, read status, channel)

8. Acceptance Criteria (Summary)

- A Company Admin can create a new role, assign permissions, and create a user with that role, end to end, without engineering support.
- A Requester can submit a request and see its live status and stage on their dashboard within the same session.
- An Approver's pending tasks appear on their dashboard filtered correctly by Overdue / Due Today / Due in 3 Days / This Week.
- All actions on a request are visible in a chronological audit trail.

8.1 Out of Scope (Version 1.0)

- Native offline mode for mobile apps.
- AI-based workflow recommendation/auto-routing (candidate for a later release).
- Deep, pre-built ERP integrations (only generic API/webhook support is in scope for v1.0).

9. Document Approval

This SRS is a living document and will be updated as requirements are refined with the client during scoping.
